DETACH PRO

2 Port Motorised Valve Actuator

DT1P Actuator

Important: Keep this document

The Detach Pro range of actuators c/w auxiliary switch are specifically designed for use in domestic applications only.

They are not designed for use in commercial or industrial applications such as schools, nursing homes or hotels where large commercial pump sets are fitted.

Warranty will be void If a valve is fitted in any application other than domestic.

Please note we have a full range of commercial and industrial valves to suit every application.

CAUTION! Installation and connection should only be carried out by a qualified person and in accordance with wiring regulations.

- Do not open the products. There are no serviceable or adjustable parts inside. The system must be fused to no more than 3 Amps.
- Isolate mains supply before installation commences.
- Isolate mains supply before attaching cable to actuator.
- Isolate mains supply before detaching cable from actuator.
- If this equipment is installed or used in a way not specified by the manufacturer, its safety may be impaired.

TECHNICAL SPECIFICATION

EPH ACTUATOR	COMPATIBLE WITH NON-EPH VALVES	MAX. CLOSE OFF PRESSURE
DT1P	Drayton® ZA5/679-2 22mm Compression Valve	1.0 Bar
	Drayton® ZA6/779-2 28mm Compression Valve	0.6 Bar

ACTUATOR			
Motor supply voltage	230V	Impedance protected motor	
Rated impulse voltage	2500V	Auxiliary contact rating	11(3)A
Power consumption	5W	Protection rating	IP20
Max. ambient temperature	50˚C		

LEAD SUPPLIED	1.2 metre cable. Earth Connection required.
ACTUATOR OPERATION	230V Power to open - Spring return to close.
	This is not a fail safe, a no fail or a safety product.
	This control is designated Type 1. AA. C in accordance with EN60730.
	Type of action is multi position. Type of movement is rotary.
MANUAL OVERRIDE	Valve may be manually opened for filling or draining the system.
	In normal operation, the lever must be in the Auto position
	If the mains power is disconnected, the valve will automatically spring return to the closed position.

Drayton® is a registered trademark of Schneider Electric Controls UK Limited and has no connection with EPH Controls.

1. Valve positioning

Install the valve so the actuator head is not below the horizontal level of the pipework. The open vent and cold feed must not be isolated. The valve must be fitted in the direction of flow.

2. Fitting the valve body to the pipework

Compression connection

Fit the valve body using the nuts and olives provided. When tightening the compression nuts ensure that only the valve body is used for grip. Take care not to overtighten. The actuator should not be mounted when fitting the valve.

3. Removal of actuator from the valve body

To remove the actuator head from the valve body ensure that the manual override lever is in the manual position. Ensure that the fixing screw located under the detach button is loosened and then press the detach button. The actuator will detach from the valve body.

4. Fitting of actuator to the valve body

Before fitting the actuator, please ensure that the manual override lever is in the raised manual position and the fixing screw is loosened. The actuator is mounted by aligning the 4mm flat spindle on the valve body to the identically sized slot on the actuator. When the valve and actuator are successfully coupled, the actuator locking mechanism will "click" into place. Now tighten the fixing screw located under the detach button.

Once the valve is fitted, place the manual override lever in the raised manual position. It is now possible to flush and drain the system to remove any foreign matter. The system can now be refilled and corrosion inhibitor may be added if required. Return the manual lever to the auto position for normal operation.

5. Wiring Connections

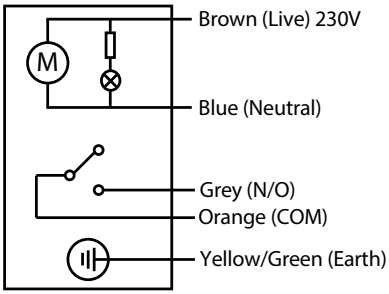
5.1 The 1.2 metre cable can be connected as follows:

WIRE COLOUR	DESCRIPTION
Brown	230V live (normally connected via room or cylinder stat)
Blue	Neutral supply
Grey	Auxiliary switch N/O (normally connected to Boiler and Pump)
Orange	Auxiliary switch COM (normally connected to 230V)
Yellow / Green	Earth connection

CAUTION!

- Ensure that no more than a 3A fuse is used to supply all controls.
- It is not permissible to use any voltage other than 230V on the auxiliary switch.
- Electrical installation must conform with current I.E.E. regulations.

5.2 Diagram:



The auxiliary switch can be used as an interlock facility, thereby ensuring any auxiliary equipment is switched OFF when the valve is in the closed position. When the valve is in the fully open position the auxiliary equipment will be switched ON.*

6. Commissioning

Once the system has been filled and vented, carry out the following to ensure correct operation of the valve.

A) Ensure the manual override lever is in the Auto position.
B) Switch on the relevant channel on the programmer.
C) Set the thermostat to maximum.
D) The valve should move to the fully open position.
E) The auxiliary switch should close and thereby switch ON any auxiliary equipment.*

Once satisfied with valve operation. Reset the programmer and thermostat to normal operating conditions.

* Examples of auxiliary equipment include boilers and pumps

WARNING!

- Under no circumstances should the actuator be insulated or covered by any other material.
- Lack of ventilation will cause the actuator to heat up beyond the maximum permissible ambient temperature of 50˚C.
